

Introducing EVI:

Empowering Electric Vehicles in the Crypto Revolution

Overview:

EVI, the Electric Vehicle Integration Currency, is poised to reshape the landscape of both cryptocurrency and electric mobility. With a fixed supply of 1 billion coins, EVI is designed to seamlessly bridge the gap between the digital financial realm and the rapidly evolving electric vehicle industry.

EVI operates on a sustainable and community-centric model. The capped supply ensures scarcity, and EVI holders benefit from a deflationary mechanism through periodic coin burns. This aligns the interests of investors with the long-term growth of EVI, creating a dynamic ecosystem.

Coin distribution and liquidity:

In circulation (60%): This refers to the portion of the cryptocurrency that was made available for circulation in market.

CEX Listing (12%): This represents the allocation for listing the cryptocurrency on centralized exchanges (CEX), which makes it accessible to a broader audience and enhances liquidity.

Surprise Burn (10%): This is a portion of the cryptocurrency supply that is intentionally destroyed or "burned." It's called a "surprise" burn because it typically happens unexpectedly, reducing the total supply and potentially increasing the value of the remaining coins.

Marketing (10%): These funds are dedicated to promoting and marketing the cryptocurrency. Marketing efforts can include advertising, community building, and other initiatives to raise awareness and adoption.

Owner Wallet (6%): This represents the percentage of the cryptocurrency allocated to the project's owner or development team. It's common for the team to hold a portion of the supply to incentivize their continued work and interest in the project.

Charity (2%): This is the allocation for charitable activities or donations. Some crypto projects allocate a portion of their funds to support social causes or charities.

These percentages outline how the initial supply of the cryptocurrency is distributed among various purposes and stakeholders in the project. Keep in mind that these allocations can vary between different projects, and they often play a role in the long-term success and sustainability of the cryptocurrency.

Electric Vehicle Integration:

EVI is not just a cryptocurrency; it's a catalyst for the electric vehicle revolution.

In collaboration with major electric vehicle manufacturers, EVI facilitates frictionless transactions for purchasing electric vehicles, accessing charging infrastructure, and participating in exclusive loyalty programs. EVI empowers users to be an integral part of the clean and efficient transportation future.

Future Vision:

As the electric vehicle market continues to surge, EVI envisions itself as the premier cryptocurrency driving positive change within the industry. By providing a seamless bridge between digital finance and electric mobility, EVI is at the forefront of a cleaner, more sustainable transportation future.

Our vehicle and AI based application:

Customize Your Bike using our application and get it to your doorstep.

Customizing a bike to fit your budget involves making choices about which modifications to prioritize. To get started, it's important to define your budget and outline your customization goals. Here are some general steps to help you with the process using our website or application

Identify your customization goals, Decide what aspects of your bike you want to modify, such as appearance, performance, or comfort

- By choosing
 - motor
 - battery
- charging speed
 - body frame
 - handle
 - tyre
 - seat
- suspension
- colour and graphics
- and more.

Allocating an additional 5-10% of revenue from our electric vehicle company into our cryptocurrency's liquidity pool can create a symbiotic relationship between our business and the crypto project.

Here's a description of how this allocation works:

Crypto Liquidity from Electric Vehicle Company Revenue (5-10%):

This percentage of our electric vehicle company's revenue is designated to bolster the liquidity pool for our cryptocurrency. By doing so, we establish a connection between our real-world business and our digital asset.

Here are the benefits:

1.Economic Synergy: This allocation allows our electric vehicle company to directly support the success of our cryptocurrency. As the cryptocurrency's liquidity pool grows, it attracts more users, which can include EV enthusiasts who might also invest in our vehicles or services.

2.Increased Coin Utility:

A well-funded liquidity pool can make our cryptocurrency more versatile. It enables users to easily buy and sell the coin, making it more attractive for both investors and consumers interested in using it for transactions within our business ecosystem.

3.Price Stability:

A larger liquidity pool can help stabilize the price of our cryptocurrency. It absorbs large trades, reducing price fluctuations and ensuring that users can transact at fair prices.

4.Enhanced Brand Integration:

By linking our electric vehicle company with our cryptocurrency in this way, we create a unique branding opportunity. It demonstrates our commitment to the crypto community and can attract a broader customer base.

5.Community Building:

Supporting the liquidity pool fosters a sense of community among cryptocurrency holders who are also our customers. This can lead to increased engagement and brand loyalty.
